LABORATORIO 44-A
——————————————————————————————————————
——————————————————————————————————————
https://divingintogenetics and genomics.rbind.io/post/a-tale-of-two-heatmap-functions/
Se instala la paquetería
install.packages("gplots")
install.packages("heatmaps")
in stall.packages ("pheatmaps")
Se cargan las librerías
library(stats) library(gplots)
Attaching package: 'gplots'
<pre>## The following object is masked from 'package:stats': ##</pre>
lowess
Medida de la expresión génica de 4 genes (h1, h2, l1 y l2) en 8 puntos de tiempo
h1 <- c(10,20,10,20,10,20,10,20) h2 <- c(20,10,20,10,20,10) 11 <- c(1,3,1,3,1,3,1,3) 12 <- c(3,1,3,1,3,1,3,1)
Generamos matriz denominada mat para enlazar los genes
mat <- rhind(h1 h2 l1 l2)

Se corren los siguientes comandos para generar el plot

```
par(mfrow =c(1,1), mar=c(4,4,1,1))
plot(1:8,rep(0,8), ylim=c(0,35), pch="", xlab="Time", ylab="Gene Expression")

for (i in 1:nrow(mat)) {
   lines(1:8,mat[i,], lwd=3, col=i)
}

legend(1,35,rownames(mat), 1:4, cex=0.7)
```

Para calcular la distancia

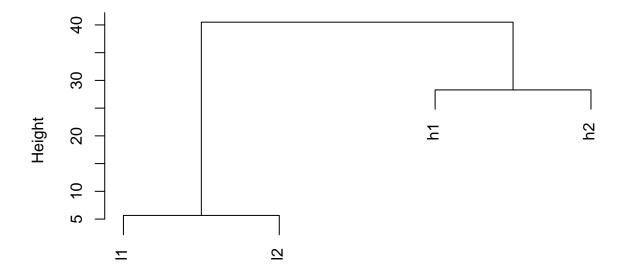

dist(mat)

```
## h1 h2 28.284271
## 11 38.470768 40.496913
## 12 40.496913 38.470768 5.656854
```

Se usa el método predeterminado para el enlace: completo

```
plot(hclust(dist(mat)))
```

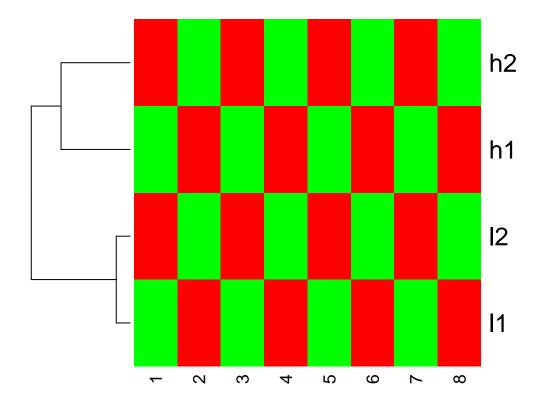

Cluster Dendrogram

dist(mat) hclust (*, "complete")

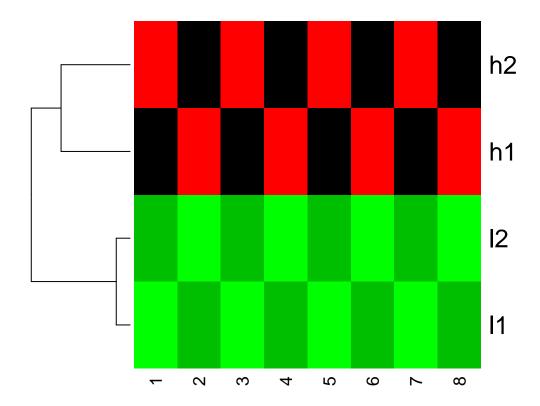

Headmap predeterminado, para obtener explicitamente parámetros Escala en los renglones con escala de color verde y roja

heatmap(mat, Colv=NA, col=greenred(10), scale = "row")

Heatmap con la escala desactivada

```
heatmap(mat, Colv = NA, col=greenred(10), scale = "none")
```

Escalando los genes antes de introducirlos al heatmap

```
mat.scaled<- t(scale(t(mat), center=TRUE, scale = TRUE))
mat.scaled</pre>
```

```

                       [,2]
                                  [,3]
                                             [,4]
                                                        [,5]
                                                                   [,6]
                 0.9354143 \ -0.9354143 \ 0.9354143 \ -0.9354143 \ 0.9354143
## h1 -0.9354143
                            0.9354143 - 0.9354143 \ 0.9354143 - 0.9354143 \ 0.9354143
## h2 0.9354143 -0.9354143
## 11 -0.9354143 0.9354143 -0.9354143 0.9354143 0.9354143 0.9354143 -0.9354143
      0.9354143 \ -0.9354143 \ 0.9354143 \ -0.9354143 \ 0.9354143 \ 0.9354143
##
            [,8]
## h1 0.9354143
## h2 -0.9354143
## 11 0.9354143
## 12 -0.9354143
## attr(,"scaled:center")
## h1 h2 l1 l2
## 15 15 2 2
## attr(,"scaled:scale")
        h1
                 h2
                          11
                                   12
## 5.345225 5.345225 1.069045 1.069045
```

Cambio e la distancia entre genes

dist(mat.scaled)

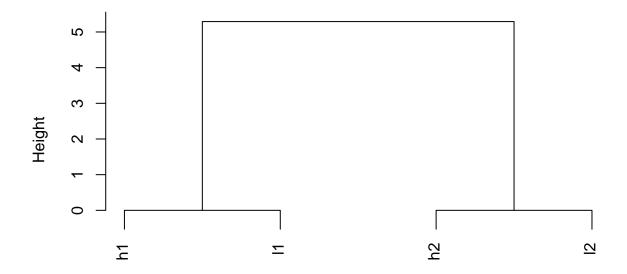

```
## h1 h2 11
## h2 5.291503
## 11 0.000000 5.291503
## 12 5.291503 0.000000 5.291503
```

Obtener el plot

Ahora h
1 y l
1 están agrupados juntos; l
2 y h
2 están agrupados juntos

plot(hclust(dist(mat.scaled)))

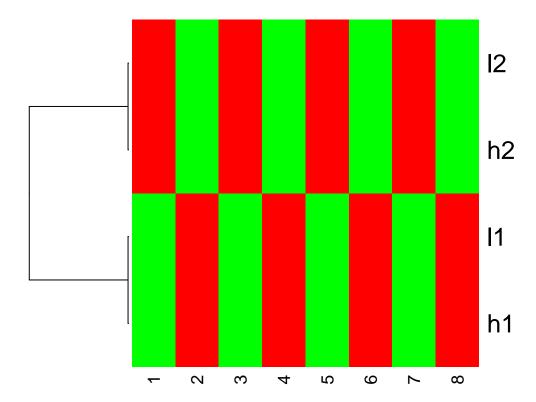

Cluster Dendrogram

dist(mat.scaled) hclust (*, "complete")

Generando el heatmap

heatmap(mat.scaled, Colv = NA, col=greenred(10), scale = "none")

Si aún no se escalan los datos pero se desea que l1 y h1 se agrupen juntos, al igual que l2 y h2, se puede usar la medida de distancia diferentes

Correlación entre genes para asignar valores de 1 y -1

cor(t(mat))

```
## h1 h2 l1 l2
## h1 l -1 l -1
## h2 -1 l -1 l
## l1 l -1 l -1
## l2 -1 l -1 l
```

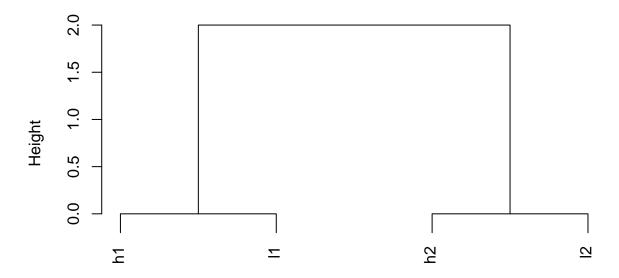

Correlación para definir la distancia

1- cor(t(mat))

```
## h1 h2 l1 l2
## h1 0 2 0 2
## h2 2 0 2 0
## l1 0 2 0 2
## l2 0 0 2
```

```
hc <- hclust(as.dist(1-cor(t(mat))))
plot(hc)</pre>
```

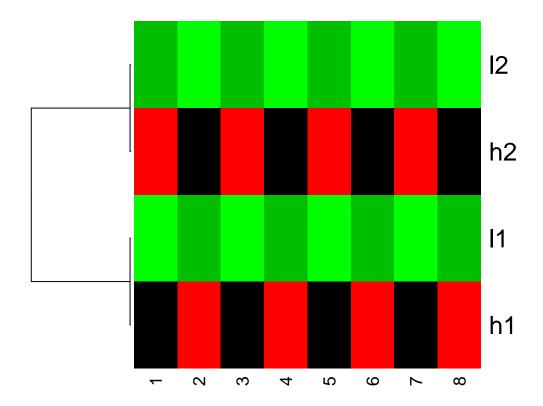

Cluster Dendrogram

as.dist(1 - cor(t(mat))) hclust (*, "complete")

 ${\it Heatmap\ sin\ escala}$

```
heatmap(mat, Colv = NA, Rowv=as.dendrogram(hc), col=greenred(10), scale = "none")
```

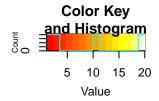

Heatmap con la escala en los renglones

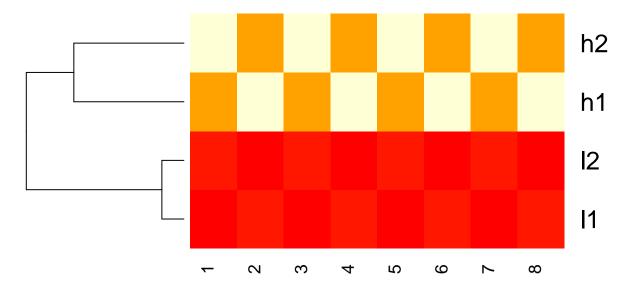

```
heatmap(mat, Colv = NA, Rowv=as.dendrogram(hc), col=greenred(10), scale = "row")
```

Valores predeterminados de heatmap.2 con ninguna escala

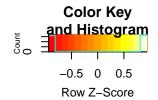

```
heatmap.2(mat, trace = "none", Colv= NA, dendrogram = "row", scale = "none")
```

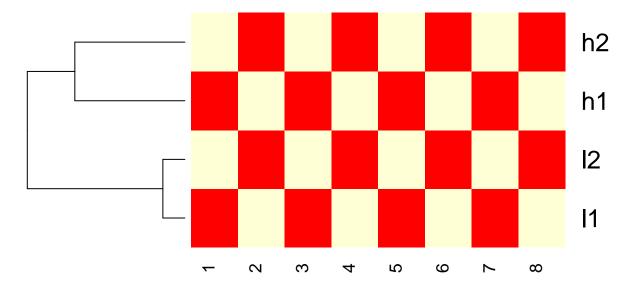

Funciones de heatmap en R: primero se agrupa y luego usa el argumento de escala (si está configurado) para representar los datos $\frac{1}{2}$

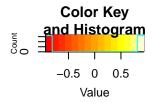

```
heatmap.2(mat, trace = "none", Colv= NA, dendrogram = "row", scale = "row")
```

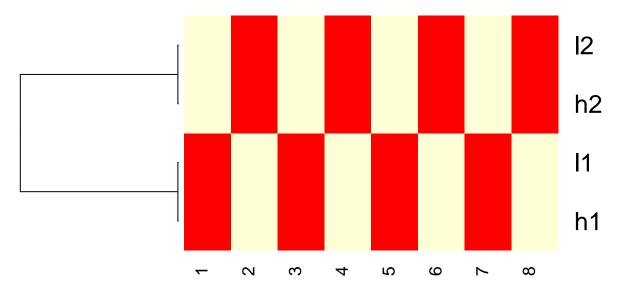

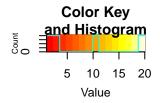

Datos escalados explícitamente primero y uso de la distancia euclidiana

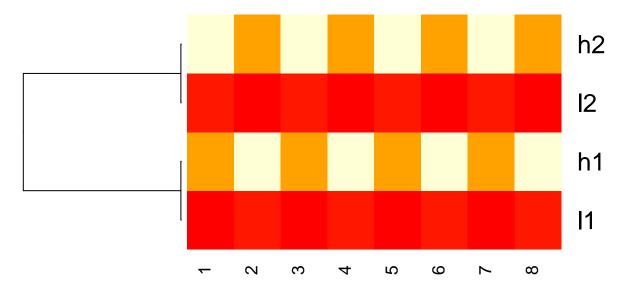

heatmap.2(t(scale(t(mat), center=TRUE, scale=TRUE)), trace = "none", Colv= NA, dendrogram = "row", scale

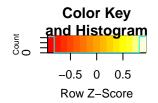

Usando 1- cor(x) como distancia y no escalar

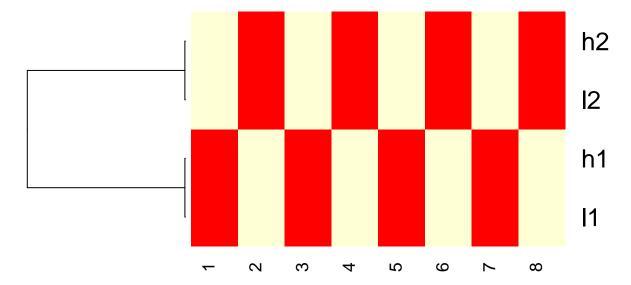

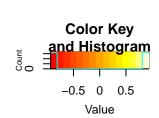

Usando 1- cor(x) como distancia y no escalar

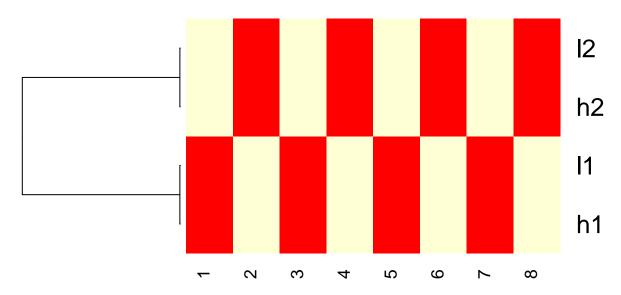

Usar la escala en la función heatmap.2 para representar los colores

Escala y uso de 1- cor(x) como distancia

FIN DE LABORATORIO 44-A
